Report Overview

A Digital SpO2 Sensor is a medical device designed to measure and monitor the oxygen saturation level in a patient's blood, commonly known as SpO2. This non-invasive sensor typically consists of a small clip or probe that is attached to the patient's fingertip, earlobe, or other extremities. It works by emitting light at two different wavelengths, which is absorbed by the blood in the capillaries and then detected by a photodetector. The device then calculates the ratio of oxygenated hemoglobin to total hemoglobin, providing a percentage value of oxygen saturation. This information is crucial for healthcare professionals to assess a patient's respiratory and cardiovascular health, especially in critical care settings, during surgery, or for patients with respiratory conditions like COPD or sleep apnea. Digital SpO2 Sensors are known for their accuracy, reliability, and ease of use, offering real-time data that aids in timely medical intervention and patient monitoring.
