Abstracts

Digital Telemetry Torque Transducers feature a non-contact digital telemetry design that enhances data acquisition integrity by increasing resolution and eliminating mechanical interference; thus providing a more accurate indication of actual torque. Friction (contact) is completely eliminated and maintenance requirements are reduced. There are no touch points in the digital telemetry system. The whole system is composed of transceiver module, coupling module and signal processing module. The transmitter module is integrated in the torque sensor and amplifies, digitizes and modulates the RF carrier signal from the sensor, which is received by the caliper coupling module (receiver). The digital measurement data is then recovered by the signal processing module.

The global Digital Telemetry Torque Transducers market size was estimated at USD 85.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
