Abstracts

Direct air capture and storage (DAC+S) removes CO₂ directly from ambient air. In contrast, carbon capture and storage (CCS) captures CO₂ from point sources of carbon dioxide, such as the smokestacks of iron and steel factories. It then transports the captured CO₂ to a storage site, where it is sequestered. Carbon Dioxide, CO₂, is commonly found in natural gas. In order to meet pipeline specifications or other application specific requirements, CO₂ separation is necessary. In addition, there may also be H₂S and H₂O present that needs to be removed. CO₂ separation membranes have been widely used for CO₂ removal applications and come with the added benefit of removing H₂S and H₂O as well.

The global Direct Air Capture and Storage (DACs) market size was estimated at USD 426.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.10% during the forecast period.
