Report Overview

A Direct-driven Wind Turbine Generator is a type of wind energy conversion system that utilizes the kinetic energy of wind to generate electricity. This system is characterized by its direct-drive technology, which eliminates the need for a gearbox to transfer the rotational energy from the wind turbine's rotor to the generator. Instead, the generator is directly connected to the turbine's rotor, allowing for a more efficient and simplified energy transfer process. This design reduces mechanical complexity, maintenance requirements, and potential points of failure, thereby increasing the reliability and longevity of the wind turbine. The generator in a direct-driven system is typically a large, slow-rotating permanent magnet synchronous machine or an induction machine, which is optimized for low-speed operation. This type of wind turbine generator is particularly suited for offshore applications and high-wind-speed environments, where the absence of a gearbox can be a significant advantage in terms of durability and performance.
