Report Overview

Disc Disease Stem Cell Therapy is a regenerative medical treatment that focuses on alleviating pain and restoring function in patients suffering from disc-related conditions. This innovative approach utilizes stem cells, which are undifferentiated cells capable of developing into various specialized cell types, to target and repair damaged intervertebral discs in the spine. The therapy involves isolating and concentrating stem cells from the patient's own body, such as from bone marrow or adipose tissue, and then injecting these cells into the affected disc. The goal is to promote the growth of new, healthy disc tissue, reduce inflammation, and alleviate pain. This non-surgical treatment option offers a promising alternative to traditional disc surgeries, with the potential to improve patient outcomes and quality of life.
