Abstracts

Disc Tube Reverse Osmosis (DTRO) Membrane is a membrane component specially used to treat high-concentration sewage. It consists of a three-layer structure of a support layer, a dense layer and a contact layer. The support layer provides the mechanical stability of the membrane, the dense layer controls the water permeability of the membrane, and the contact layer provides the anti-pollution performance of the membrane. The working principle of DTRO membrane is to separate water and solutes through forward osmosis, concentration and re-osmosis. It has the characteristics of high pressure resistance, high SDI resistance, high COD resistance, wide flow channel design, easy cleaning and maintenance, etc. It is widely used in the fields of landfill leachate treatment, electroplating wastewater treatment, chemical wastewater treatment, coal and mining wastewater treatment, etc., and performs well in treating high-concentration and high-difficulty wastewater.

The global Disc Tube Reverse Osmosis Dtro Membrane market size was estimated at USD 182.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
