### Report Overview

A disposable blood pressure sensor is a medical device used to measure patient blood pressure. It is designed for one-time use and is typically used in hospitals, clinics, and other medical institutions. The sensor consists of a cuff wrapped around the patient's arm, a pressure sensor, and a display unit that displays the patient's blood pressure reading. The working principle of a disposable blood pressure sensor is to inflate the cuff to a pressure higher than the patient's systolic blood pressure, then slowly release the pressure, while monitoring the pressure changes in the cuff. The pressure sensor detects pressure changes and converts the pressure reading into an electrical signal. Then, the electrical signal is sent to the display unit, which displays the patient's blood pressure reading.
