Report Overview

A Disposable Dry Powder Inhaler is a single-use, handheld medical device designed to deliver dry powdered medication directly into the lungs for the treatment of respiratory conditions such as asthma and chronic obstructive pulmonary disease (COPD). This device is characterized by its simplicity and ease of use, as it requires no propellant gases or complex mechanisms. It typically consists of a mouthpiece, a chamber to hold the powdered medication, and a mechanism to release the powder when the patient inhales. The inhaler is designed to ensure that the medication reaches the deep lung areas, providing effective and targeted therapy. Once the medication is used, the inhaler is discarded, minimizing the risk of cross-contamination and ensuring the sterility of each dose. This type of inhaler is often preferred for its convenience, portability, and the lack of need for cleaning or maintenance.
