### Report Overview

The disposable insufflation needle is a single-use medical device designed for minimally invasive surgical procedures, particularly laparoscopic surgeries, where it is used to inflate the abdominal cavity with carbon dioxide (CO<sub>2</sub>) to create a working space for surgeons. These needles are typically made of high-grade stainless steel or medical-grade polymers, featuring a sharp, beveled tip for precise insertion and a safety mechanism to prevent accidental punctures. Their disposable nature reduces the risk of cross-contamination and eliminates the need for sterilization, ensuring compliance with stringent healthcare hygiene standards. The needle is often equipped with a stopcock or valve to regulate gas flow and prevent leakage, enhancing procedural efficiency and patient safety. Increasing adoption of laparoscopic techniques, coupled with rising demand for cost-effective and infection-resistant surgical tools, drives the market for disposable insufflation needles.
