Report Overview

A disposable nasogastric tube is a medical device that is inserted through the nasal cavity and extends into the small intestine. It is used to provide nutritional support, drug delivery, and gastrointestinal decompression. It is particularly suitable for patients who cannot normally take in nutrients through the stomach or need to avoid gastric retention. This tube is usually made of soft polyvinyl chloride (PVC) or silicone material and is flexible enough to reduce irritation to the nasal cavity and throat. The insertion process of the nasogastric tube is relatively complicated and usually requires imaging guidance to ensure that the end of the tube accurately reaches the small intestine (such as the duodenum or jejunum).
