Report Overview

A Dissolved Air Flotation (DAF) System is a water treatment technology that utilizes the principle of air flotation to separate suspended and floating solids from water. The process involves dissolving air under pressure into the water, which is then released into a flotation tank. As the air is released, it forms tiny bubbles that attach to the suspended particles, causing them to float to the surface where they can be easily removed. This system is widely used in various industries, such as wastewater treatment, food processing, and paper manufacturing, for its efficiency in removing suspended solids, fats, oils, and grease. The DAF system is particularly effective in treating water with high concentrations of suspended solids and is known for its low operational costs, compact design, and ease of maintenance.
