Report Overview

Distributed Energy Resources (DERs) refer to small-scale power generation units or demand-side management systems located close to end-users, often integrated into local grids or microgrids. These resources include solar panels, wind turbines, battery storage systems, combined heat and power (CHP) units, and demand response technologies, enabling decentralized energy production and consumption. DERs enhance grid resilience, reduce transmission losses, and support renewable energy adoption by allowing consumers to generate, store, and manage their own electricity. Unlike traditional centralized power plants, DERs operate flexibly and can function independently during grid outages, making them critical for energy security and sustainability. The rise of smart grid technologies and regulatory incentives has further accelerated DER adoption, positioning them as a key component of modern energy systems.

The global Distributed Energy Resources (DERs) market size was estimated at USD 46255.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.60% during the forecast period.
