Report Overview

A Distributed Power System is an electrical power generation approach that involves the use of multiple, smaller-scale power generation units, typically located close to the point of consumption. These systems are designed to provide electricity to a specific area or community, rather than being centralized in large power plants. The key features of a Distributed Power System include modularity, scalability, and the ability to integrate various energy sources such as solar, wind, or natural gas. This approach offers benefits such as reduced transmission losses, increased system resilience, and the potential for local energy generation to reduce dependency on centralized power grids. It also promotes energy efficiency and can contribute to a more sustainable and environmentally friendly energy infrastructure.
