### Report Overview

A distributed telematics control unit is a system that distributes control decisions and functions to multiple nodes in the network. These nodes exchange information and collaborate through communication protocols to jointly realize the telematics and control of the vehicle. The system usually includes multiple modules such as power rail, charging management, interface, emergency call unit, wireless connection unit, antenna, etc., each of which has a specific function. The distributed telematics control unit realizes the telematics and control of the vehicle through the collaborative work between the modules. For example, when an emergency occurs in the vehicle, the emergency call unit will trigger the emergency call process and send the vehicle's location and status information to the rescue center through the wireless connection unit; at the same time, the power rail and charging management module will ensure that the system has sufficient power supply throughout the process.
