Report Overview

Distributed Temperature Sensing (DTS) is an advanced technology that enables the continuous and precise measurement of temperature along the entire length of an optical fiber. This innovative technique leverages the principle of backscattering, where light is sent through the fiber and the returning signal is analyzed to determine temperature variations. The technology is particularly valuable for applications requiring real-time, high-resolution temperature monitoring over extended distances, such as in industrial processes, environmental monitoring, and infrastructure management. DTS systems can detect temperature changes with high accuracy and resolution, providing critical data for process control, safety, and efficiency.
