Report Overview

A Distributorless Ignition System, also known as a Direct Ignition System, is an advanced automotive ignition technology that eliminates the traditional distributor in favor of individual ignition coils for each spark plug. This system directly controls the ignition timing and spark delivery to each cylinder, resulting in improved fuel efficiency, reduced emissions, and enhanced engine performance. The primary components of a distributorless ignition system include a crankshaft position sensor, a camshaft position sensor, an ignition control module (ICM), and individual ignition coils. The ICM processes the signals from the sensors to determine the precise timing for each spark plug, ensuring optimal combustion and power output. This system is designed to provide more accurate and consistent spark delivery, which can lead to better engine performance and reduced maintenance requirements.
