### Report Overview

DNA Cleanup Buffers are specialized reagents designed for the purification and cleanup of DNA samples, primarily used in molecular biology and genetic research. These buffers are formulated to selectively bind and isolate DNA from other cellular components, such as proteins, lipids, and other contaminants, that may interfere with subsequent analysis. The primary function of DNA Cleanup Buffers is to ensure that the DNA sample is free from impurities, which can affect the accuracy and reliability of downstream applications such as PCR, sequencing, and gene expression studies. The buffers work by binding to DNA, allowing it to be separated from other cellular debris through a series of washes and centrifugation steps. This process results in a purified DNA sample that is suitable for further manipulation and analysis, ultimately contributing to the integrity and success of genetic research and diagnostics.
