### Report Overview

DNA Damaging Agents are a class of chemical or physical substances that have the potential to cause damage to the DNA molecule, which is the genetic material found in all living organisms. These agents can induce various types of DNA lesions, such as single-strand breaks, double-strand breaks, base modifications, and crosslinks, which can lead to mutations, genomic instability, and ultimately contribute to the development of diseases like cancer. DNA damaging agents can be naturally occurring, such as ultraviolet (UV) radiation from the sun, or synthetic, like certain chemotherapeutic drugs used in cancer treatment.
