Report Overview

DNA Methylation Chip is a cutting-edge molecular biology tool designed to study the methylation patterns of DNA, a crucial epigenetic modification. This product utilizes microarray technology to analyze the methylation status of specific DNA sequences across the genome. It consists of a chip that contains thousands of probes, each complementary to a specific CpG site or region of interest. When DNA samples are hybridized to the chip, the probes bind to their complementary sequences, allowing for the detection and quantification of methylation levels at these sites. This technology is widely used in research to understand gene regulation, identify biomarkers for diseases such as cancer, and study the role of epigenetics in various biological processes. The DNA Methylation Chip provides a high-throughput, comprehensive analysis of DNA methylation, enabling scientists to gain insights into the complex interplay between genetics and environmental factors.
