Report Overview

Dodecyltrimethylammonium Bromide (DTAB) is a quaternary ammonium compound widely used as a cationic surfactant. It is an organic salt derived from dodecylamine, where three hydrogen atoms are replaced by methyl groups, and the remaining nitrogen atom is bonded to a bromide ion. DTAB is characterized by its amphiphilic nature, with a hydrophobic alkyl chain and a hydrophilic quaternary ammonium head group. This property allows it to lower surface tension in aqueous solutions, making it effective in applications such as detergents, fabric softeners, and emulsifiers. It is also used in various industrial processes, including the extraction of DNA and proteins, as a flocculant in water treatment, and as a phase-transfer catalyst in organic synthesis. DTAB's cationic nature makes it suitable for applications where positively charged surfaces need to be interacted with, and it is known for its ability to form micelles and other aggregates in solution.
