Report Overview

Doped Cesium Iodide Crystal is a high-performance scintillation material used in various applications, particularly in the field of radiation detection and imaging. This product is a crystalline form of cesium iodide (CsI) that has been doped with impurities to enhance its scintillation properties. The doping process introduces trace amounts of other elements, such as thallium or sodium, into the crystal lattice, which significantly improves the light output and decay time of the material when exposed to ionizing radiation. As a result, doped cesium iodide crystals are highly sensitive and fast-responding detectors, making them ideal for use in gamma-ray spectroscopy, medical imaging, and nuclear physics research. The product is typically sold in the form of polished crystals or as a component in scintillation detectors, and its performance characteristics, such as energy resolution and detection efficiency, are critical factors in its application.
