Report Overview

The Doppler Fetus Detector is a medical device designed to monitor the fetal heart rate and movements during pregnancy. It utilizes the Doppler effect, a phenomenon where the frequency of a wave changes for an observer moving relative to the wave source. In this context, the device emits inaudible sound waves that reflect off the fetus's heart and return to the device. By analyzing the frequency shift of these reflected waves, the device can accurately measure the fetal heart rate, providing crucial information about the baby's health and well-being. This non-invasive tool is commonly used by healthcare professionals during prenatal check-ups and can help detect potential issues such as fetal distress or placental problems, allowing for timely intervention and ensuring the safety of both the mother and the unborn child.
