Report Overview

A Double Acting Piston Seal is a type of mechanical seal specifically designed for use in hydraulic or pneumatic systems where a piston moves in both directions. It is engineered to provide a reliable seal on both the rod and the piston, ensuring optimal performance and preventing fluid leakage. The seal is typically composed of a primary sealing element that interfaces with the piston or rod, and a secondary element that seals against the housing or cylinder wall. The design of a double acting piston seal often includes features such as wear rings, backup rings, and sometimes a spring or energizer to maintain constant contact with the sealing surfaces, even under varying pressures and speeds. These seals are critical in maintaining system efficiency, preventing contamination, and ensuring the longevity of the equipment by minimizing wear and tear on the piston and cylinder components.
