### Report Overview

Double Containment Pipes are a specialized type of piping system designed to provide enhanced safety and environmental protection in the transportation of hazardous or potentially polluting materials. These pipes consist of two concentric layers, with the inner layer carrying the fluid and the outer layer serving as a protective barrier. The primary function of the double containment system is to prevent leaks and spills by containing any potential breaches within the outer layer, thereby minimizing the risk of contamination to the surrounding environment. This design is particularly crucial in industries such as chemical processing, oil and gas transportation, and waste management, where the consequences of a leak could be severe. Double Containment Pipes are engineered to withstand high pressures and are often made from corrosion-resistant materials to ensure durability and reliability over time.
