Report Overview

A Double and Triple Vane Pump is a type of mechanical device used in various industries for transferring fluids from one location to another. This pump operates on the principle of positive displacement, where fluid is moved by rotating vanes within the pump chamber. The double vane pump features two vanes, while the triple vane pump has three vanes. These vanes are evenly spaced around the pump's rotor, which rotates within a cylindrical casing. As the rotor turns, the vanes move fluid from the suction side to the discharge side, creating a continuous flow. Double and triple vane pumps are known for their high efficiency, low noise levels, and ability to handle a wide range of fluid viscosities. They are commonly used in applications such as hydraulic systems, lubrication systems, and chemical processing, where precise fluid control and reliability are crucial.
