Abstracts

Lapping and Polishing Machines are specialized industrial machines used for precision surface finishing, smoothing, and polishing of various materials, typically metals, ceramics, and optical components. These machines use abrasive slurries or compounds to remove imperfections, such as scratches, irregularities, or oxidation, from the surfaces of workpieces, resulting in a highly smooth and reflective finish. They are commonly employed in industries requiring high-precision components and fine surface quality. Automation and computerized control systems are becoming more common in lapping and polishing machines, allowing for precise control over the process and reducing operator dependence. The growing demand for advanced materials, such as ceramics and composites, is driving the need for specialized lapping and polishing solutions to achieve the desired surface finish. With the trend toward smaller and more precise components in electronics and optics, there is an increased need for micro-lapping and micro-polishing machines.

The global Double-side Lapping Polishing Machines market size was estimated at USD 447.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
