Report Overview

A Double Vane Pump is a type of mechanical device used in various industrial applications to transfer fluids, typically liquids, from one location to another. It operates on the principle of rotary motion, where a rotor with two vanes is placed eccentrically within a cylindrical housing. As the rotor rotates, the vanes move in and out, creating a partial vacuum that draws fluid into the pump and then compresses it as the vanes move outward, forcing the fluid through the discharge port. This design allows for a continuous, pulsation-free flow, making it suitable for applications requiring a stable fluid transfer. Double Vane Pumps are known for their high efficiency, low noise operation, and ability to handle a wide range of fluid viscosities, making them a versatile choice in the fluid handling industry.
