Report Overview

Dronedarone hydrochloride is an antiarrhythmic drug used to treat atrial fibrillation and atrial flutter by stabilizing heart rhythm. It belongs to the class III antiarrhythmic agents but also exhibits properties of classes I, II, and IV, making it a multichannel blocker. The drug is marketed under the brand name Multaq and is primarily prescribed for patients with a history of paroxysmal or persistent atrial fibrillation to reduce the risk of hospitalization due to cardiovascular events. Its mechanism involves inhibiting potassium, sodium, and calcium channels while also exerting antiadrenergic effects. However, its use is restricted in patients with severe heart failure due to safety concerns, as it may increase mortality risks in certain high-risk groups. The market for dronedarone hydrochloride is influenced by the growing prevalence of atrial fibrillation, an aging population, and the demand for effective rhythm-control therapies, though competition from other antiarrhythmic drugs and stricter regulatory guidelines impact its adoption.
