Report Overview

A Drug Eluting Sinus Stent (DESS) is a specialized medical device designed for use in the treatment of chronic sinusitis. It is a small, flexible tube made of biocompatible materials, such as nitinol or stainless steel, which is inserted into the sinus cavity to maintain patency and facilitate proper drainage. The stent is coated with a drug-eluting layer that releases medication, such as corticosteroids or anti-inflammatory agents, directly into the sinus tissue over an extended period. This localized drug delivery aims to reduce inflammation, promote healing, and prevent re-narrowing or scarring of the sinus passages. The DESS is typically used after endoscopic sinus surgery to enhance the surgical outcomes and improve patient recovery by providing a controlled release of medication at the site of inflammation.
