Report Overview

Dry etching equipment for semiconductor refers to a sophisticated machinery used in the semiconductor manufacturing process. It is specifically designed to remove or etch material from a semiconductor substrate, such as silicon, in a highly controlled and precise manner. This equipment operates by utilizing plasma or reactive ion etching techniques, which involve the use of a vacuum chamber, gaseous chemicals, and an applied electric field to create a plasma that reacts with the substrate surface. The process is critical for creating the intricate patterns and structures necessary for the functioning of integrated circuits and other semiconductor devices. Dry etching is preferred over wet etching methods due to its ability to achieve higher resolution, better control over the etching process, and compatibility with a wider range of materials used in modern semiconductor fabrication.
