Abstracts

Dry rotary vane vacuum pumps and compressors are devices that utilize rotating vanes to process gases. They are primarily composed of components such as the pump body, rotor, and vanes. Gas enters through the inlet port and is separated by the rotating vanes into chambers of constantly changing volume. As the rotor rotates, these chambers gradually move from the inlet side to the exhaust side. During this process, the chamber volume decreases, and the gas is compressed. When the chamber reaches the exhaust port, the gas, which has been compressed to the set pressure, is discharged. The equipment operates in an air-cooled, oil-free, dry manner, thus preventing any contact between lubricating oil and the pumped medium. This results in oil-free emissions and facilitates easy maintenance and servicing.

The global Dry Rotary Vane Vacuum Pumps Compressors market size was estimated at USD 350.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
