Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on DSA Coated Titanium Anode competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. DSA (Dimensionally Stable Anode) coated titanium anode, also known as MMO (Mixed Metal Oxide) coated titanium anode, is a type of electrode used in electrochemical processes. It consists of a titanium substrate coated with a mixed metal oxide (MMO) layer, such as ruthenium oxide or iridium oxide. This coating provides excellent electrocatalytic activity and corrosion resistance, making it suitable for various applications like water treatment, electroplating, and electrowinning. The DSA coated titanium anode is the core component of the electrolysis process. Electrolysis technology is the use of electrochemical principles to electrolyze salt solutions through anodes and cathodes to achieve the preparation of new materials. The electrolysis products are important raw materials for the national economy. DSA coated titanium anode plays a decisive role in the electrolysis process. Its performance and structure are not only related to electrolysis energy consumption, product purity and output, but also directly affect the production cost and production environment of downstream enterprises. With the continuous development of electrolytic product technology, electrode materials have also experienced three generations of technological innovation and development due to their own characteristics. The first generation is traditional graphite electrodes. The second generation is lead-based alloy electrodes. The third generation is titanium-based metal oxide coated electrodes (DSA coated titanium anode). DSA coated titanium anodes have strong corrosion resistance and are more green, energy-saving and efficient. With the improvement of people's environmental awareness, efficient, green and energy-saving titanium anodes will inevitably develop strongly to replace traditional electrodes. At the same time, the proportion of new fields

such as water electrolysis to produce hydrogen is gradually increasing, and the market space for related electrode materials in the future is broad.

The global DSA Coated Titanium Anode market size was estimated at USD 1169.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
