Report Overview

A dual channel coagulation analyzer is a medical device used to measure the clotting capacity of blood. It is similar to a four channel coagulation analyzer, but it has two independent channels instead of four. This means that it can perform two different coagulation tests simultaneously, which is useful for laboratories with lower sample sizes to be tested. The working principle of a dual channel coagulation analyzer is to add reagents to a patient's blood sample and measure the time required for blood coagulation. Then analyze the results and report them to the clinical doctor. Like the four channel coagulation analyzer, the dual channel coagulation analyzer can perform a series of tests, including prothrombin time (PT), activated partial thromboplastin time (aPTT), fibrinogen, and D-dimer tests. The selection of dual channel and four channel coagulation analyzers will depend on the specific needs of the laboratory or medical institution. Laboratories with higher sample sizes may benefit from increased throughput of four channel analyzers, while those with lower sample sizes may find dual channel analyzers more cost-effective.
