Report Overview

A dual-channel dual-beam atomic absorption spectrophotometer is an atomic absorption spectrophotometer that uses dual light sources, dual spectroscopic systems, and dual detection and display systems. In this instrument, the light emitted by each light source is divided into two beams by a beam splitter: one beam passes through the atomizer as a measurement beam and is partially absorbed by ground state atoms; the other beam does not pass through the atomizer and is only used as a reference beam, and its light intensity remains unchanged during the measurement process. By comparing the intensity difference between the measurement beam and the reference beam, the content of the element to be measured in the sample can be accurately determined.
