Report Overview

A dual-channel single-beam atomic absorption spectrophotometer refers to an instrument with two independent light sources, two monochromators (spectrometric systems) and two detection and display systems, but only one beam. This design allows the instrument to process samples of two different elements at the same time and detect them through a single optical path, thereby improving analysis efficiency and flexibility. The instrument is equipped with two independent light sources and two monochromators, and each light source and monochromator combination is responsible for the detection of one element. This design ensures that each element can get the light source and spectroscopic conditions that best suit its characteristics. Dual-channel single-beam atomic absorption spectrophotometers are widely used in environmental monitoring, food testing, pharmaceutical analysis and other fields, especially in scenarios where multiple elements need to be analyzed simultaneously. For example, in environmental monitoring, multiple heavy metal elements in water samples can be detected simultaneously; in food testing, nutrients and harmful substances in food can be analyzed simultaneously.
