Report Overview

A Dual Containment Pipe is a specialized type of piping system designed to provide enhanced safety and environmental protection for the transportation of hazardous materials, such as chemicals, gases, or fluids. This system features two concentric pipes, with the inner pipe carrying the substance and the outer pipe serving as a secondary containment barrier. The space between the two pipes is typically filled with a monitoring medium, such as air or a non-conductive fluid, which allows for the detection of any leaks or breaches in the inner pipe. The dual containment design not only prevents the escape of the transported material but also facilitates easy identification and containment of leaks, thereby reducing the risk of environmental contamination and ensuring compliance with safety regulations. This type of pipe is commonly used in industries where the safe and secure transportation of hazardous substances is critical, such as chemical processing, oil and gas, and waste management.
