Abstracts

Dynamic balance inspection service is a professional service aimed at the detection and evaluation of unbalance problems in rotating machinery (such as motors, fans, pumps, etc.). This service is usually provided by a professional balancing technician or company. In a balancing inspection service, a professional technician uses balancing equipment, such as a hard bearing balancer or a soft bearing balancer, to measure the vibration and imbalance of rotating machinery. They mount machinery or its components to balancing equipment and measure vibration signatures while the equipment is in operation. By analyzing the characteristics of the vibration signal, the unbalance position and magnitude of the rotating machinery can be determined. Once the inspection is complete, the technician generates a balance report that includes information on the machinery's imbalance, vibration levels, correction recommendations, and more. According to the report, the owner of the machinery can take appropriate action, such as adding or removing corrective mass, to correct the imbalance. The purpose of the dynamic balance inspection service is to ensure that the rotating machinery has a good balance during operation, thereby reducing the risk of vibration, noise and mechanical damage, and improving the operating efficiency and life of the machinery. This service is often provided by professional repair and maintenance companies and is especially important for industries that require high-precision balancing, such as aerospace, automotive manufacturing, energy, etc.

The global Dynamic Balance Inspection Service market size was estimated at USD 85.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
