Report Overview

A dynamic focus lens is a photographic lens that has the function of automatically adjusting the focal length, enabling the photographer to change the focus position during shooting. This type of lens is commonly used in photography and videography to capture subjects at different distances and depths. Dynamic focus lenses use a built-in autofocus system to achieve focus adjustment. It can automatically adjust the focus according to the position and movement of the subject to maintain a clear image quality. By adjusting the lens in different focal length ranges, photographers can quickly switch the ability to shoot close-ups or long-range shots, increasing creativity and flexibility. In photography and film production, dynamic focus lenses are often used for tracking effects, that is, to adjust the focus as the subject moves during shooting to maintain the sharpness of the subject. This effect can create a striking visual that immerses the viewer even more in the frame. It is worth noting that the dynamic focus lens is usually used in conjunction with the corresponding camera equipment or camera system to achieve automatic focus and focus adjustment functions. In modern digital cameras and video cameras, the control of this lens is usually done by the camera's autofocus system and electronic control system.
