Abstracts

An earthquake early warning transmitter is a device that receives and transmits earthquake early warnings. There are two types of Earthquake Early Warning System (EWS) alerts: warnings and forecasts. A warning is issued for seismic waves detected at multiple stations with an expected maximum intensity of 5 or lower. A forecast is released when P-waves or S-waves exceed 100 gals at any station, with a magnitude of 3.5 or more or an expected maximum intensity of 3 or more. These forecasts are updated for accuracy and transmitted by earthquake early warning transmitters to display predicted seismic intensity and arrival time, controlling devices like elevators and building announcement systems.

The global Earthquake Early Warning Transmitter market size was estimated at USD 185.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.45% during the forecast period.
