### Report Overview

Echelle Grating is a specialized type of diffraction grating used in spectroscopy, particularly in high-resolution spectrometry. It is characterized by a periodic structure with a high density of evenly spaced, parallel grooves, which can range from a few hundred lines per millimeter to several thousand lines per millimeter. This high groove density allows for the dispersion of light into a wide range of wavelengths, enabling the simultaneous measurement of multiple spectral lines. Echelle gratings are often used in conjunction with a cross-disperser to separate the dispersed light into its individual spectral components, which is crucial for applications such as astronomical observations, chemical analysis, and remote sensing. The design of an Echelle Grating is optimized for high efficiency and resolution, making it an essential component in advanced spectroscopic instruments.

This report provides a deep insight into the global Echelle Grating market covering all its essential aspects.
