Abstracts

Rails are one of the most important and, at the same time, most stressed elements of the railroad transport and metropolitan, since they are particularly exposed to the loading caused by the rolling stock as well as the dynamic loading. Due to the increased speed of the trains for the last years, and the increment loading of the freight cars, the development of service, fatigue-type defects in the place of contact of the train wheel with the rail head surface may occur. These are so-called ?Rolling contact fatigue? (RCF) defects. One of the defects type appearing at the place of contact of the wheel flange with the rail head gauge face is called ?Gauge corner checking?. The area which is the most exposed to damages is the gauging face of the external rail located in curves. In order to execute the maintenance and service works of the track in more cost-effective manner, the defects detection like Gauge corner checking shall be performed at the early development stage so to eliminate damages afterwards through the grinding procedure, whereas the untimely removal of the defects may cause the growth of the them and further complete breaking of the. The task that is mentioned above can be succe
