### Report Overview

Edge Node Service refers to a distributed computing model where processing and data storage are decentralized, moving closer to the source of data generation (edge devices) to reduce latency, enhance real-time processing, and improve bandwidth efficiency. This service leverages a network of geographically dispersed nodes to deliver applications, content, or compute resources at the edge of the network, enabling faster response times and reduced reliance on centralized cloud infrastructure. It is particularly critical for industries requiring low-latency operations, such as IoT, autonomous vehicles, telemedicine, and augmented reality, as well as for content delivery networks (CDNs) optimizing media streaming and web performance.
