Report Overview

EEG Cup Electrodes are specialized medical devices designed for the acquisition of electroencephalogram (EEG) signals, which are electrical activities generated by the brain. These electrodes are typically made of conductive materials such as silver/silver chloride and are shaped in a cup or cap form to ensure optimal contact with the scalp. They are used in various medical, research, and diagnostic settings to monitor brain function, diagnose neurological disorders, and assess cognitive states. The design of EEG Cup Electrodes facilitates easy placement and removal, and they often come pre-gelled or with a gel cap to enhance signal quality by reducing impedance between the electrode and the scalp. Their placement on the scalp follows the international 10-20 system, a standardized method for electrode positioning to ensure consistency and comparability across different EEG recordings.
