Report Overview

The elastomer infusion pump is a medical device designed for controlled and continuous delivery of fluids, such as medications or nutrients, into a patient's body. It operates via an elastomeric reservoir that stores the fluid and gradually releases it through pressure-driven flow, eliminating the need for electronic components or external power sources. These pumps are widely used in pain management, antibiotic therapy, chemotherapy, and post-operative care due to their portability, ease of use, and cost-effectiveness compared to electronic infusion systems. The global market for elastomeric infusion pumps is driven by the rising demand for home healthcare solutions, increasing prevalence of chronic diseases, and the need for minimally invasive treatment options.
