Abstracts

The electric vehicle battery cooling system is a technical system specially designed to maintain the battery pack within a suitable operating temperature range to ensure battery performance, extend service life and improve safety. The system effectively dissipates the heat generated by the battery during the charging and discharging process by using methods such as liquid cooling, air cooling or phase change materials. Liquid cooling systems usually include coolant circulation pumps, radiators and heat exchangers, which can provide efficient thermal management; air cooling systems rely on fans and diversion designs to promote air circulation and remove excess heat. In addition, some advanced cooling systems also integrate intelligent temperature control technology, which can monitor battery temperature in real time and automatically adjust the cooling intensity. In the future, the development trend of electric vehicle battery cooling systems will pay more attention to high efficiency and intelligence, and will develop in the direction of integration and environmental protection. On the one hand, with the increase in battery energy density and the increase in fast charging demand, the development of cooling technologies with higher efficiency and faster response capabilities has become the key. For example, innovative methods such as nanofluids or direct immersion cooling can significantly improve the heat dissipation effect without increasing the complexity of the system. On the other hand, the application of smart sensors and algorithms will make the cooling system more intelligent, achieve precise control and energy consumption optimization, thereby improving the overall vehicle energy efficiency. At the same time, in order to support sustainable development goals, the design of the cooling system will also pay more attention to the selection of environmentally friendly materials and the improvement of energy utilization efficiency to reduce the impact on the environment. These advances not only improve the safety and performance of batteries, but also provide a solid technical foundation for the widespread use of electric vehicles.

The global Electric Car Battery Cooling System market size was estimated at USD 7776.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.00% during the forecast period.
