### Report Overview

Electric Fire Dampers are safety devices designed to prevent the spread of fire and smoke within a building's ventilation system. These dampers are installed in ductwork and are equipped with a fusible link or a heat-sensitive element that triggers the damper to close when a fire is detected. The closure of the damper helps to contain the fire within a specific area, reducing the risk of it spreading to other parts of the building. Electric Fire Dampers are typically controlled by a fire alarm system, which sends a signal to the damper to close when the temperature in the ductwork reaches a predetermined threshold. They are an essential component in maintaining the integrity of a building's fire protection system and ensuring the safety of its occupants.
