### Report Overview

An Electric Radiant Panel is a type of heating system that utilizes electric resistance to generate heat. It consists of a flat panel with embedded heating elements, typically made of materials like carbon or metal alloys, which convert electrical energy into infrared heat. When an electric current passes through these elements, they emit heat, which is then distributed evenly across the surface of the panel. This heat is transferred to the surrounding environment through radiation, providing a comfortable and efficient method of warming a space. Electric Radiant Panels are known for their energy efficiency, silent operation, and ability to maintain consistent temperatures without the need for forced air circulation. They are commonly used in residential, commercial, and industrial settings for both floor and wall heating applications.
