Report Overview

An Electrical Fire Sensor is a safety device designed to detect the early signs of an electrical fire. It is a component of a fire detection system that monitors electrical circuits for abnormal conditions, such as excessive heat or arcing, which can be indicative of a potential fire hazard. This device is typically installed within electrical panels, switchboards, or other areas with high concentrations of electrical wiring. The sensor operates by continuously monitoring the temperature and electrical activity within the monitored area. Upon detecting a significant increase in temperature or the presence of electrical arcs, the sensor sends an alert to a control panel or a monitoring station, initiating a response protocol to mitigate the risk of fire. This early warning system can help prevent electrical fires, protect property, and ensure the safety of individuals in the vicinity.
