Abstracts

Electrically Heated Catalytic Convertor is an advanced emission control device used in internal combustion engine vehicles to reduce harmful exhaust emissions. Unlike traditional catalytic converters, which rely on the heat generated by the engine to become operational, electric heating catalytic converters use electrical energy to heat the catalyst to its optimal operating temperature more quickly. This is particularly beneficial during cold starts when most emissions are generated.

The global Electrically Heated Catalytic Convertor market size was estimated at USD 85.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.25% during the forecast period.
