Report Overview

Heated Tobacco is a type of tobacco product that utilizes a heating element to warm the tobacco to a temperature below the combustion point, thereby releasing nicotine and flavor compounds without burning the tobacco. This method is designed to reduce the harmful byproducts associated with traditional cigarette smoking, as the process avoids the combustion of tobacco, which is responsible for the production of tar and other carcinogenic substances. Heated Tobacco products are often marketed as a less harmful alternative to traditional cigarettes, and they are typically used with specialized devices that control the heating process to optimize the release of nicotine and minimize the production of harmful chemicals. The technology behind Heated Tobacco products is intended to provide a similar sensory experience to smoking while potentially reducing health risks, although the long-term health effects are still a subject of ongoing research and debate.
